

Haul Pro – Vision & Requirements Document (VRD)

1. Product overview

HaulPro is a digital compliance platform for transport companies that replaces paper-based vehicle and driver compliance processes with a web and mobile app. Drivers perform daily vehicle checklists, upload documents, create notes, and manage appointment reminders, while managers and super admins oversee clients, fleets, and compliance data.

2. Business objectives

- Reduce manual paperwork and administrative effort by digitising daily checks, document storage, and planning.
- Improve safety and legal compliance by ensuring every vehicle undergoes a documented daily checklist and that supporting documents are up to date.
- Provide transparent, accessible records of maintenance, fuel consumption, and driver activities for audits and client reporting.

3. Stakeholders & user roles

- Super Admin (HaulPro HQ): Owns the platform, sets up new client accounts, and appoints managers.
- Manager (Client Transport Manager): Manages drivers and vehicles, reviews checklists, documents, and reports for their depot or company.
- Driver: Uses the mobile app to complete checklists, upload documents, record notes, and manage appointments and planners.

4. Scope of the system

4.1 In-scope (Phase 1)

- Multi-tenant environment where each client's data is isolated but centrally controlled by Super Admin.
- Role-based access: Super Admin portal, Manager portal, Driver mobile/web app.
- Core driver functions: daily checklist (with location capture), document uploads in folders, notes, planner/appointments, and simple reports (maintenance, fuel consumption).

4.2 Out-of-scope (Phase 1)

- Advanced telematics and live GPS tracking.
- Automated billing and subscription payments.
- Complex analytics beyond basic aggregated reports.

5. High-level business requirements

5.1 Super Admin

- Ability to create, view, edit, and deactivate client accounts.
- Ability to create and manage managers under each client and configure global checklist templates and note categories.

5.2 Manager

- Ability to onboard and manage drivers and vehicles for their client.
- Ability to view all operational data (checklists, appointments, notes, reports) for assigned drivers and vehicles.

5.3 Driver

- Ability to log in, see account validity, and perform daily checklists, uploads, notes, and planner operations with minimal steps.
- Ability to work primarily from mobile devices with a clean, simple UI and bottom navigation (Checklist, Upload, Report, Planner).

6. Constraints & assumptions

- System will be web-based with complementary mobile apps (iOS/Android) to support drivers on the road.
- Each client is responsible for data entered; HaulPro provides storage and access controls in a private cloud environment.
- Connectivity may be intermittent for drivers; app should handle basic offline data capture with sync when online (assumption for design).

7. Non-functional requirements (high-level)

- Security: HTTPS for all traffic, hashed passwords, role-based authorisation, and tenant isolation.
- Usability: Simple, intuitive screens with minimal data entry per step, optimised for mobile resolutions as shown in current UI.
- Performance: Typical operations (login, checklist submission, opening folders) should complete in under 3 seconds under normal load.
- Reliability: Cloud storage with regular backups and audit logs for key actions
